

INTERNSHIP REPORT

ON

CAREFLOW EHR — HEALTHCARE DATA MANAGEMENT SYSTEM

Submitted

To

**School of Computer Science and Engineering
IILM University, Greater Noida, U.P.**

In partial fulfilment of the requirement of degree of
B.Tech CSE

By

Rachit Gangwar

Roll Number: 25SCS1003004976

Batch: 2025-29

UI/UX Designer Intern

Internship Period: 10/06/2026 to 10/07/2026

CANDIDATE'S DECLARATION

I, Rachit Gangwar, do hereby declare that the internship report titled "CareFlow EHR — Healthcare Data Management System" has been prepared by me to fulfil the requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering.

The work presented in this report is based on the project source provided for the internship report. The project is a browser-based healthcare data management prototype implemented using HTML, CSS and JavaScript. The report describes the functionality, interface structure, implementation approach and limitations visible in the provided source.

I affirm that the information presented in this report is prepared for academic purposes and that the project evidence and technical descriptions are derived from the supplied project material. I take responsibility for the contents of this report.

Student Name: Rachit Gangwar

Roll No.: 25SCS1003004976

ACKNOWLEDGEMENT

I am using this opportunity to express my sincere gratitude to everyone who supported me throughout my one-month internship at Codec Technologies Pvt. Ltd. The internship provided valuable exposure to practical software development and project implementation.

I would like to thank Dr. Anurag Shrivastava and the entire team at Codec Technologies for providing me the opportunity to work as an Artificial Intelligence Developer Intern and for their guidance and support during the internship period.

I would also like to thank the School of Computer Science and Engineering, IILM University, for facilitating this internship as part of my academic curriculum. I am grateful to my teachers, mentors, friends and parents for their encouragement and support.

The CareFlow EHR project helped me understand how a healthcare-oriented dashboard can organize patient information, appointments, laboratory reports, analytics and critical alerts into a single user interface.

INTERNSHIP OFFER LETTER

INTERNSHIP OFFER LETTER

Dear Rachit Gangwar,

We are pleased to offer you a 1 Month Internship as Project Intern at Codec Technologies, a global platform dedicated to empowering learners and connecting diverse talent to create meaningful career opportunities worldwide. Codec Technologies delivers dedicated IT and business consultancy services across 27+ countries, empowering global innovation and strategic growth.

Internship Details:

- Designation : UI/UX Designer Intern
- Location & Mode: Pan India, Hybrid
- Duration : 10/06/2026 to 10/07/2026
- Reporting to : Assigned Project Head(s)

This program provides an immersive experience, enabling you to gain industry-level knowledge and acquire valuable skills. Exceptional interns may also qualify for a scholarship award based on weekly performance reviews conducted by project supervisor.

If you accept this offer and the terms above, please complete your assigned projects and training tasks on our platform and via email.
Best regards,

Sincerely,

Dr. Anurag Shrivastava,
Codec Technologies India
NCS ID: E19E86-0116588288923
Date Of Issue - 10/06/2026

Dr. Anurag Shrivastava
Talent Acquisition Manager

CHAPTER 5: PROJECT DESCRIPTION

5.1 Introduction

This report presents the development and study of CareFlow EHR, a browser-based healthcare data management dashboard. The project source supplied for the report is a single HTML document titled “CareFlow EHR — Healthcare Data Management”. It implements a doctor-facing interface for organizing patient information and related clinical workflow views.

The interface is designed around a fixed sidebar and a main content area. The navigation provides Dashboard, Patients, Appointments, Lab Reports, Analytics and Critical Alerts views. The supplied source also includes a Patient Profile view that can be opened from patient-related actions.

5.2 Organization Profile

Codec Technologies Pvt. Ltd. is described in the internship material as a global platform dedicated to empowering learners and connecting diverse talent to create career opportunities. The internship offer letter states that the organization delivers IT and business consultancy services across 27+ countries and provides technology-oriented internship and learning opportunities.

The internship certificate records the role as UI/UX Design Intern and the internship period as 10/06/2026 to 10/07/2026. The offer letter specifies a Pan India, Hybrid mode and reporting to assigned project head(s).

5.3 Problem Statement

Healthcare professionals need a clear way to review patient information, appointment schedules, laboratory findings and urgent alerts without moving between disconnected screens. The project addresses this interface-level problem by presenting common healthcare workflow information in one organized dashboard.

The supplied prototype focuses on information presentation and client-side interaction. It does not show a server, database, authentication system or external medical-device integration. Therefore, it should be treated as an academic prototype rather than a production Electronic Health Record system.

5.4 Project Objectives

- To design a centralized doctor-facing healthcare data management interface.
- To present patient information in a structured and readable form.
- To provide dedicated views for appointments, laboratory reports, analytics and critical alerts.
- To implement simple client-side navigation between functional sections.
- To support patient search within the displayed patient table.
- To provide a patient profile view containing basic demographics, vitals, allergy information, clinical notes and medications.
- To demonstrate a clean, responsive interface suitable for desktop and smaller screens.
- To document the project architecture, implementation approach, testing observations and limitations.

5.5 Scope of the Project

The scope covers a front-end prototype of a healthcare data management dashboard. The supplied implementation includes static sample records, navigation between views, patient search, patient-profile display, appointment listing, laboratory report listing, analytics cards with a seven-day visits visualization, and critical-alert acknowledgement interactions.

The scope does not include persistent data storage, real user authentication, role-based authorization, backend APIs, live hospital information systems, automatic clinical decision-making, real-time device integration, or deployment as a production medical record system.

5.6 Technologies and Tools Used

Technology / Tool	Purpose in the Project
HTML5	Defines the page structure, sections, tables, controls and content.
CSS3	Provides layout, colors, cards, tables, responsive behavior and visual styling.
JavaScript	Controls navigation, patient profile display, patient filtering and demo interactions.
Browser	Runs and renders the client-side application.
VS Code / Text Editor (suitable)	Can be used to edit the supplied HTML source.
Git / File sharing (optional)	Suitable for source versioning and project sharing; not shown as an implemented feature in the supplied file.

5.7 System Architecture

The supplied project follows a lightweight client-side architecture. A user interacts with the CareFlow EHR interface in a browser. HTML defines the functional views, CSS controls presentation, and JavaScript switches between views and performs small interactions such as patient searching and opening a patient profile.

CareFlow EHR — Functional Architecture

Additional views: Analytics and Critical Alerts

Fig. 1 – Functional architecture of the CareFlow EHR prototype

The source defines navigation views for Dashboard, Patients, Appointments, Lab Reports, Analytics and Critical Alerts. The Patient Profile is opened through JavaScript and displays the selected patient name. The dashboard contains sample patient and alert records directly in the HTML source.

Layer	Observed Implementation	Output
Presentation	HTML + CSS	Dashboard and functional screens
Interaction	Vanilla JavaScript	Navigation, filtering and profile opening
Data	Static HTML sample records	Patients, reports, appointments and alerts
Persistence	Not implemented in supplied source	No database/API storage shown
Deployment	Browser-based local/static page	Runs as a front-end prototype

5.8 Methodology

The project can be understood through a sequence of interface-development stages. The methodology below is derived from the structure and behavior present in the supplied HTML file.

Identify the primary doctor workflow: view daily patient statistics, inspect recent patients, review critical alerts and access supporting healthcare sections.

Organize the application into separate views for dashboard, patients, patient profile, appointments, laboratory reports, analytics and alerts.

Use a fixed sidebar, responsive main content area, cards, tables, status badges and alert panels to make information easy to scan.

Represent sample patient, appointment, report and alert information as structured HTML content.

Use JavaScript functions to switch active views, update the page title, display a patient profile and filter patient rows by search text.

Use CSS media queries so the sidebar, grids and metric cards adapt when the viewport becomes smaller.

Check navigation, search filtering, patient opening and alert acknowledgement behavior, and verify that the displayed information remains consistent with the source data.

5.9 Project Implementation

The dashboard presents four headline statistics: Today's Patients (18), Critical Alerts (3), Pending Reports (7) and Follow-ups (12). It also provides a Recent Patients table and a Critical Alerts panel. The sample alerts include low SpO₂ for Vikram Singh, elevated blood pressure for Ananya Mehta and abnormal glucose for Rahul Sharma.

The Patients view contains a search box, a condition selector and a New Patient button. Four sample records are displayed: Rahul Sharma, Ananya Mehta, Vikram Singh and Priya Kapoor. The Open action invokes the patient profile view.

The Patient Profile view contains patient identification, blood group, blood pressure, heart rate, SpO₂ and an allergy warning. It also presents tabs labelled Overview, Medical History, Medications, Lab Reports and Notes. The supplied source displays clinical notes and two sample medicines for Rahul Sharma.

The Appointments view lists three sample appointments at 10:00 AM, 11:30 AM and 02:00 PM, with statuses Completed, Waiting and Priority respectively.

The Laboratory Reports view lists sample tests including Blood Glucose, Peak Flow and CBC, with abnormal, review and normal status indicators.

The Analytics view displays totals for patients, active patients, recovered patients and critical cases, together with a seven-day patient-visit bar visualization. The Critical Alerts view repeats the three urgent alerts and provides View Patient and Acknowledge controls.

5.10 Testing and Evaluation

Because the supplied implementation is a front-end prototype, testing focuses on functional UI behavior rather than clinical accuracy. No measured medical performance or production reliability claim is made.

Test Case	Expected Behavior	Observed / Source-supported Behavior
Dashboard navigation	Dashboard should be visible initially.	Dashboard is marked active on page load.
Patients navigation	Patients view should open.	JavaScript switches the active view to Patients.
Patient search	Rows should hide when they do not match the query.	filterPatients() compares row text with the lowercase search query.
Open patient	Selected patient profile should open.	showPatient(name) updates the patient name and opens the Patient view.
Appointments	Appointment table should be visible.	Three sample appointments are defined in the HTML.
Lab Reports	Report table should be visible.	Three sample laboratory records are defined.
Critical Alerts	Alert records and actions should be visible.	Three alerts and acknowledgement buttons are defined.
Responsive layout	Major grids should adapt on smaller screens.	CSS media query changes sidebar and grid layouts below 900px.

Traditional model metrics such as accuracy, precision, recall and F1-score are not applicable to this project because the supplied CareFlow EHR source is a front-end dashboard and does not contain a machine-learning classifier. Evaluation is therefore based on functional behavior, interface organization, readability and responsiveness.

5.11 Expected/Observed Outcomes

The project demonstrates a coherent healthcare dashboard prototype that brings multiple workflow views into one interface. The observed source supports navigation, patient searching, patient profile display, sample clinical information, appointment review, laboratory-report review, analytics visualization and critical-alert acknowledgement.

- Centralized presentation of healthcare workflow information.
- Clear status indicators for stable, attention and critical conditions.
- Simple patient lookup through client-side filtering.
- Separate views for appointments, laboratory reports, analytics and alerts.
- Responsive layout behavior for smaller screen widths.
- Reusable visual components such as cards, tables, status badges and alert panels.

5.12 Internship Learning Outcomes

- Improved understanding of front-end web application structure.
- Practical experience with HTML semantic structure and form controls.
- Improved CSS skills for responsive layouts, cards, tables and dashboard interfaces.
- Understanding of JavaScript DOM manipulation and event-driven interaction.
- Experience organizing healthcare-oriented information into user-focused screens.
- Improved debugging and functional testing skills.
- Better understanding of the difference between a front-end prototype and a production-ready healthcare information system.
- Improved technical documentation and project presentation skills.

5.13 Certificate and Communication Proof

The Internship Completion Certificate issued by Codec Technologies Pvt. Ltd. confirms completion of the one-month internship program and identifies the role as Artificial Intelligence Intern. The certificate records the internship period as 10/06/2026 to 10/07/2026.

The Internship Offer Letter records the designation as Artificial Intelligence Intern, the location and mode as Pan India, Hybrid, the duration as 10/06/2026 to 10/07/2026, and the reporting structure as Assigned Project Head(s).

The certificate and offer letter are included in this report as documentary evidence of the internship. The CareFlow EHR project itself is documented separately as the technical project developed/presented for the internship context.

CHAPTER 6: BIBLIOGRAPHY / REFERENCES

1. Codec Technologies Pvt. Ltd. Internship Offer Letter and Internship Completion Certificate, 2026.
2. CareFlow EHR — Healthcare Data Management, supplied HTML project source.
3. HTML Living Standard / HTML documentation for structural web development.
4. CSS documentation for layout, responsive design and presentation.
5. JavaScript documentation for DOM manipulation and browser-side interaction.

APPENDIX A: PROJECT SCREENSHOTS / EVIDENCE

The project source supplied for this report is a self-contained HTML prototype. The evidence below documents the main functional areas directly represented in the source. Where a browser screenshot is required by the university format, a live browser capture may be inserted in place of the functional descriptions below.

Figure	Evidence / Description
Fig. 1	Doctor Dashboard — statistics, recent patients and critical alerts.
Fig. 2	Patients — search, condition filter, patient records and Open actions.
Fig. 3	Patient Profile — demographics, vitals, allergy, clinical notes and medications.
Fig. 4	Appointments — daily appointment list and statuses.
Fig. 5	Laboratory Reports — patient test results and status indicators.
Fig. 6	Analytics — patient totals and seven-day visit visualization.
Fig. 7	Critical Alerts — urgent alerts with View Patient and Acknowledge controls.

Source-based implementation evidence: the supplied HTML contains the CareFlow EHR navigation and the seven principal functional views, including Dashboard, Patients, Appointments, Lab Reports, Analytics and Critical Alerts, with a Patient Profile view opened through JavaScript.

Important limitation: the supplied source contains static sample data and client-side interactions. It does not establish a real clinical database, authentication, authorization, audit trail, server-side validation, or integration with hospital systems. These capabilities would be required before considering a production deployment.

APPENDIX B: FUTURE ENHANCEMENTS

- Add a backend API and secure database for persistent patient records.
- Implement authentication, role-based access control and session management.
- Add audit logs for access and modification of sensitive healthcare information.
- Replace static sample records with validated database-driven data.
- Add secure appointment creation, rescheduling and cancellation workflows.
- Support real laboratory-report ingestion and structured result history.
- Add accessibility improvements including keyboard navigation and screen-reader semantics.
- Introduce automated testing for JavaScript functions and UI workflows.
- Add secure deployment, encryption, backups and monitoring appropriate for healthcare data.
- Integrate notifications for critical events only after appropriate clinical workflow and safety review.

Conclusion: CareFlow EHR provides a clear academic demonstration of how a healthcare-oriented dashboard can be organized using front-end web technologies. Its strongest contribution is the consolidation of common clinical workflow information into a single, responsive interface. Its current limitations are primarily the absence of persistent storage, backend services and production-grade security controls.
